Student Name: Chaoran Li Student NetID: cxl190012

University of Texas at Dallas Department of Computer Science CS6320 – Natural Language Processing Spring 2021

Instructor: Dr. Sanda Harabagiu
Take-Home Mid-Term Exam

Issued: March 25th 2021

Due: March 27th 2021 – before MidNight **Submit in eLEarning as PDF file**

DO NOT DELETE ANYNITHING, Simply add your answers!!!!!

If you submit only the solution with no problems, you will receive 0 points!!!!

Instructions: Do not communicate with anyone in any shape or form. This is an independent exam. Do not delete any problem formulation, just attach your answer in the space provided. If the problem is deleted and you send only the answer, you shall receive ZERO points. If you do not write your name and netid, it will be considered that you did not submit your Midterm exam, and will obtain ZERO points.

Copy and paste the Midterm Exam into a Word document, enter your answers (either by typing in Word, or by inserting a VERY CLEAR picture of your hand-written solution) and transform the file of the exam into a PDF format. If we cannot clearly read the picture, you will get ZERO for that answer! If you create an enormous file for your final exam (i.e. larger than 5 Mbytes) you will receive ZERO for your entire exam. Please follow the instructions from the attached **instructions_submission_EXAM.pdf** file to make sure your final pdf file is of reasonable size.

If you will use a pencil instead of a black pen, you will receive a ZERO for the entire final exam.

Make sure that you insert EACH answer immediately after EACH question. Failure to do so will result in ZERO points for the entire exam! Submit the PDF file with the name **Final_Exam_netID.pdf**, where netID is your unique netid provided by UTD. If you submit your exam in any other format your will receive ZERO points.

The MidTerm exam shall be submitted in eLearning <u>before the deadline</u>. No late submissions shall be graded! Any cheating attempt will determine the ENTIRE grade of the final exam to become ZERO.

Write your answers immediately after the problem statements. If you enter multiple possible answers to the same problem – the most incorrect answer shall be selected and graded (as you are not sure about which answer is the correct one!)

Problem 1 Language Models [TOTAL: 50 points]

You are given the Bigram probability matrix \mathbf{M} containing evaluations on the Training corpus of the maximum likelihood estimations of the probabilities of the bigrams for the words "Tom", "talks", "a", "lot" and "sometimes". The corpus has 2500 sentences (with not punctuation signs!) and a vocabulary $|\mathbf{V}| = 25$. You also know that the unigram counts for the words are: Tom = 1500, a = 1000, talks = 2000; sometimes=550 and lot = 400. The matrix \mathbf{M} is:

	<s></s>	Tom	talks	а	lot	sometimes	
<s></s>	0.0	0.65	0.0	0.15	0.0	0.2	0.0
Tom	0.0	0.0	0.7	0.0	0.0	0.3	0.0
talks	0.0	0.0	0.0	0.65	0.0	0.15	0.2
а	0.0	0.0	0.0	0.0	0.9	0.1	0.0
lot	0.0	0.2	0.1	0.0	0.0	0.6	0.1
sometimes	0.0	0.2	0.5	0.0	0.0	0.0	0.3
	1	0.0	0.0	0.0	0.0	0.0	0.0

a) [**10 points**] Reconstruct the bigram counts matrix from the bigram probabilities. Show how you obtained your calculations!

Problem a): Solution: MLE n-grams (without smoothing): P(WN WN-N+1) = C(WN-1 WN)/C(WN-N+1) >> C(WN-1 WN) = P(WN-1 WN) C(WN-N+1) Besides, 2500 sentences => 2500<5> and 2500 5								
	45>	Tom	talks		lot	sometimes	4/5>	
<5>	0.0000	abstatoo	0.0 x1540	OUTATIO	OUSKLADO	0.1 X120	0.0 x2533	
Tom	000000000000000000000000000000000000000	ocexisos	07×1500	0044500	2000 OT 15 15	0-3 4/202	00 × 1500	
talks	0.04200	DOXXDO	Coorton	0.65 x2000	CONTA G.O	0-15×2010	0-5×5000	
a	0.0x1000	occlass	0.0 × 100	0.0 1 500	0.9 x 1000	0-1 ×(000	0.0x(300	
14	000	ceptaco	01×400	0.04400	20×400	u6x400	0.1 2400	
sometimes	ooxtso	UZX550	osxsto	voxtro	00 x550	0.0 1550	0.3×550	
4/5>	1 x2500	38882516A	aoxisto	0-0×2500	0.04750	のっつというう	0.0 X7200	

Hence, we can get the below results:

	<s></s>	Tom	talks	a	lot	sometimes	
<s></s>	0	1625	0	375	0	500	0
Tom	0	0	1050	0	0	450	0
talks	0	0	0	1300	0	300	400
a	0	0	0	0	900	100	0
lot	0	80	40	0	0	240	40
sometimes	0	110	275	0	0	0	165
	2500	0	0	0	0	0	0

b) [5 points] Using the bigram probability matrix, compute the probability of the sentence "Tom talks a lot sometimes" and compare it to the probability of the sentence "Sometimes Tom talks a lot".

"Tom talks a lot sometimes" has a higher possiblility.

c) [10 points] You also know that in the training corpus there is only one other word in the vocabulary that forms bigrams with $w_1=Tom$, $w_2=talks$, $w_3=a$, $w_4=lot$, namely $w_5=home$.

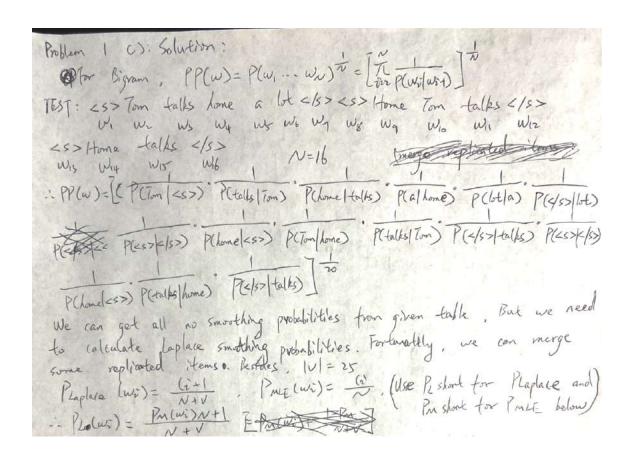

The unigram count for w_5 is 15000 in the Training corpus. You also know the following bigram probabilities from the Training corpus:

	(S> 0.0	Tom	talks	а	lot	home	
<s></s>		0.7	0.0	0.1	0.1	0.1	0.0
Tom	0.0	0.0	0.75	0.1	0.1	0.05	0.0
talks	0.0	0.0	0.0	0.65	0.2	0.1	0.05
а	0.0	0.0	0.0	0.0	0.3	0.6	0.1
lot	0.0	0.2	0.4	0.3	0.0	0.05	0.05
home	0.0	0.5	0.0	0.1	0.3	0.0	0.1
	1.0	0.0	0.0	0.0	0.0	0.0	0.0

Considering the following test set:

TEST: [Tom talks home a lot. Home Tom talks. Home talks.]

Show how you compute the perplexity of this bigram model smoothed with the Laplace method (5 points) and compare it to the perplexity of the language model when no smoothing was applied (5 points)

```
PL(Ton/cs>) = 0.7×2500+1 = 0.693465 PL(talks Tom) = 0.75×1500+1 = 0.73836|

PL(bone | talks) = 0.1×1500+1 = 0.093457 PL(a | home) = 0.1×1500+1 = 0.099900

PL(lot | a) = 0.2×1500+1 = 0.293658 PL(c/s>| lot) = 0.05×1600+1 = 0.049412

PL(cs/cs) = 10.000+24 = 0.293658 PL(c/s>| lot) = 0.05×1600+1 = 0.049412

PL(cs/cs) = 10.000+24 = 0.293658 PL(c/s>| lot) = 0.049412

PL(Tonl home) = 0.5×1600+1 = 0.99649 PL(talks | Tom) = 0.1×1500+1 = 0.091406

PL(fonk | cs) + 0.5×1600+1 = 0.049876 PL(talks | Tom) = 0.1×1500+1 = 0.73836|

PL(c/s>| talks) = 0.05×1000+1 = 0.049876 PL(c/s/c/s>) = 0.990495

PL(talks | home) = 0.091406

PL(talks | home) = 0.091406

PL(talks | home) = 0.0191406

PL(talks | home) = 0.0191406

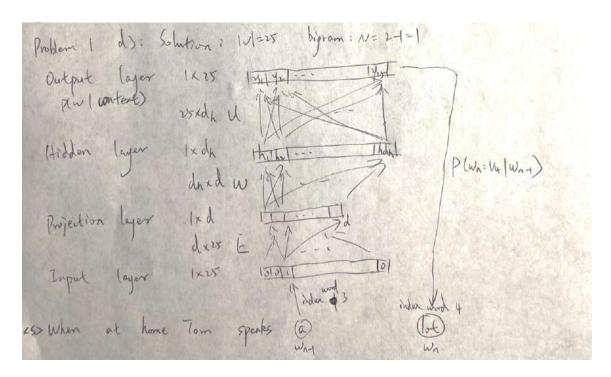

PL(talks | home) = 0.0191406

PL(talks | home) = 0.00066

PLaplace (w) = [0.5/2655x 0.73836| x 0.091876 x 0.09
```

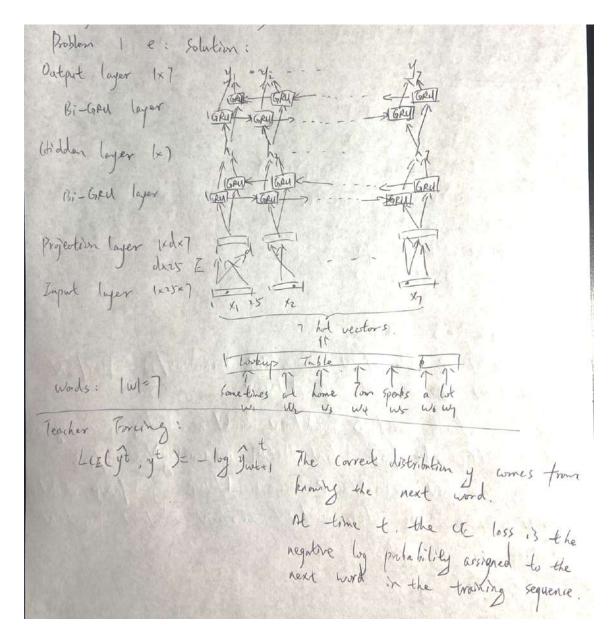

We have $PP_{Laplace}(w) = 6.843318$ and $PP_{no-smoothing}(w) = \infty$.

d) [10 points] Draw a non-recursive neural architecture that allows you to (1) learn a neural language model from the training set and (2) learn in the same time the embeddings of the words. Exemplify the neural architecture working on the word sequence "When at home Tom speaks a" and show how it will predict the word "lot". [3 points] Detail the parameters of the neural model and explain how they are learned. Write the equations that define the working of this neural architecture [7 points]

Equations:

e) [15 points] Draw a recursive neural architecture that uses two stacked bi-directional GRU layers for learning a neural language model that operates on the word sequence "Sometimes at home Tom speaks a lot". [3 points] Detail the parameters of the neural model and explain how teacher forcing can be used and why. [5 points] Write the equations that define the working of this neural architecture [7 points]

Equations:

The = o (Wxx+ Uxht-1+br)

Zt = o (Wxx+ Uxht-1+br)

The = tenh (Wxx+Uh(x+0ht-1+br))

ht = (1-2e) 0 ht-1 + 2t 0 ht

ht = wtht + wbhb

Wt = o (wxht+ Urhtot+br)

Zt = o (wxht+ Urhtot+br)

Zt = o (wxht+ Urhtot+br)

At = tenh (Whht+ Uhrlx+br)

ht = -tenh (whht+ Uhrlx+0ht-12)+bhr)

ht = (1-2te) 0 ht-12 + Ztr 0 htr

et = wthnt + wbhb

Exerp(wyte+bj)

Exerp(wyte+bj)

Problem 2 (POS Tagging) (30 points)

a) (5 points) Using the Penn Treebank Part-of-Speech (POS) tag-set, manually assign tags for the following sentences:

Tag	Description	Example	Tag	Description	Example
CC	coordin. conjunction	and, but, or	SYM	symbol	+,%, &
CD	cardinal number	one, two, three	TO	"to"	to
DT	determiner	a, the	UH	interjection	ah, oops
EX	existential 'there'	there	VB	verb, base form	eat
FW	foreign word	mea culpa	VBD	verb, past tense	ate
IN	preposition/sub-conj	of, in, by	VBG	verb, gerund	eating
JJ	adjective	yellow	VBN	verb, past participle	eaten
JJR	adj., comparative	bigger	VBP	verb, non-3sg pres	eat
JJS	adj., superlative	wildest	VBZ	verb, 3sg pres	eats
LS	list item marker	1, 2, One	WDT	wh-determiner	which, that
MD	modal	can, should	WP	wh-pronoun	what, who
NN	noun, sing. or mass	llama	WP\$	possessive wh-	whose
NNS	noun, plural	llamas	WRB	wh-adverb	how, where
NNP	proper noun, singular	IBM	\$	dollar sign	\$
NNPS	proper noun, plural	Carolinas	#	pound sign	#
PDT	predeterminer	all, both	66	left quote	or "
POS	possessive ending	's	,,	right quote	or"
PRP	personal pronoun	I, you, he	(left parenthesis	[, (, {, <
PRP\$	possessive pronoun	your, one's)	right parenthesis],), }, >
RB	adverb	quickly, never	,	comma	,
RBR	adverb, comparative	faster	5	sentence-final punc	.!?
RBS	adverb, superlative	fastest	:	mid-sentence punc	: ;
RP	particle	up, off			

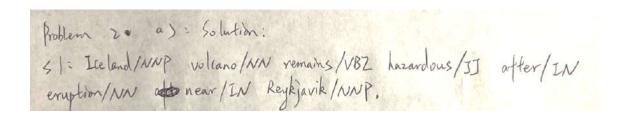

S1: Iceland volcano remains hazardous after eruption near Reykjavik.

S2: Concerns were raised about the proximity of the volcano to the country's main airport, Keflavik International Airport, which is just a 25 min car ride from the peninsula.

To annotate the POS tags, you may use the following format:

John/NNP and/CC Mary/NNP bought/VBD a/DT refrigerator/NN with/IN three/CD doors/NNS

S1: (2 points)

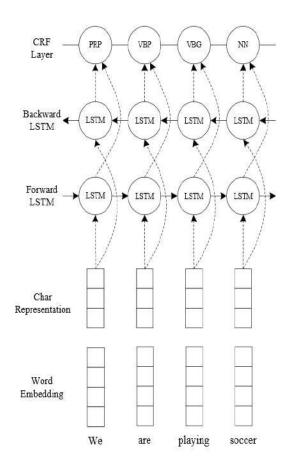

S2: (3 points)

52: (oncerns/NNS were/VBD raised/VBN about/IN the/DT proximity/NN of/IN the/DT wolcano/NN to/IN the/DT concountry/NN 's/pos main/JJ airport/NN. Ketavik/NNP International/NNP Airport/NNP. which/hot is/VBZ just/RB a/DT 25/CD min/NN car/NN ride/NN trom/IN the/DT peninsula/NN.

b) Neural POS Tagging (10 points)

The architecture of a Neural Conditional Random Field (CRF) used for Part-of-Speech (POS) Tagging is represented below (where word embeddings and character embeddings are concatenated:

Explain how the POS tags are learned to be assigned. (5 points) What parameters does this neural architecture have and explain how are they used and learned? (5 points)

Auestion 2 b): Solution:

First, words are transformed into hot vectors by word embeddings and characters embeddings.

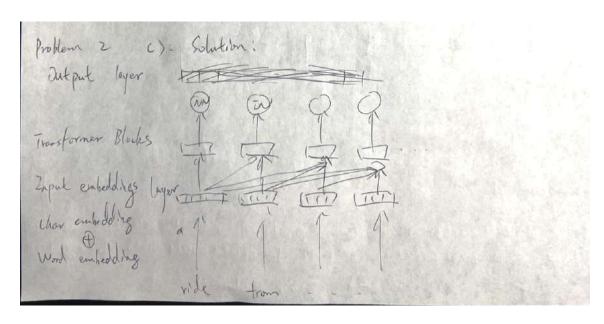

Then, with bi directional LSTM layers, we did not compute the probability for each tag of each step. Instead, we used by linear functions to get a global probability for the whole sequence.

Possible tag sequences: $\widehat{T} = argmax P(7/w)$ P(Y|X) = $\frac{exp(\underbrace{Funfk(X;Y)}}{Eupf(\underbrace{Funfk(X;Y)}}$ (where output than for previous output token for input storing X current parition \widehat{x} .

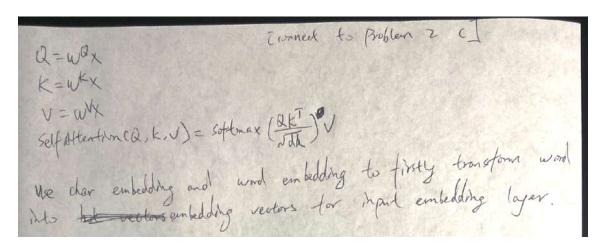

Then, we have: $\widehat{T} = argmax \underbrace{\widehat{S}}_{Y} \underbrace{Eupf(Y)}_{Y} \underbrace{Wkfk(Y)}_{Y}, Y_{Y}, X_{Y}, \widehat{x}}$

c) Propose a transformer-based architecture for performing POS tagging. Draw the architecture, give the equations and discuss how the self-attention is computed (10 points). How do you implement and represent the input to your neural architecture?

(5 points).

Equations and input solution:

Problem 3 (Affect) (20 points)

The SentProp Algorithm has computed the following Positive and Negative scores for the polarity of words:

LEXICON: { (change: $w^{pos}=0.66 \text{ w}^{neg}=0.34$); (hate: $w^{pos}=0.22$, $w^{neg}=0.78$), (love: $w^{pos}=0.75$, $w^{neg}=0.25$); (opposite: $w^{pos}=0.27$, $w^{neg}=0.63$), (suffer: $w^{pos}=0.25$, $w^{neg}=0.75$); (thrive: $w^{pos}=0.88$, $w^{neg}=0.12$), (want: $w^{pos}=0.69$, $w^{neg}=0.31$), (wish: $w^{pos}=0.55$, $w^{neg}=0.45$)}.

a) Given this lexicon, determine the sentiment of the following text and explain providing details how you obtained the resulting sentiment, considering that the threshold you will consider in your computation is T=0.55 [10 points]

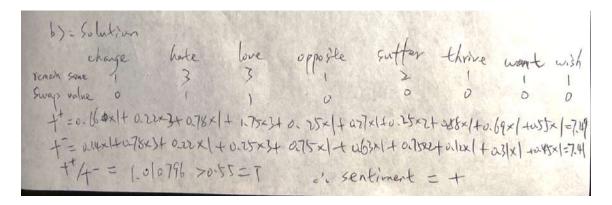

TEXT: Love and hate are similar in being directed toward another person because of who he or she is. Despite this similarity, the two seem like polar opposites. Very often when we love someone, we want them to thrive. When we hate someone, we are more likely to wish they would suffer — or at least change who they are. If she loves you, it doesn't mean she is not capable of hate. If you hate him now and suffer because of it, it does not mean you never loved him.

Solution:

Positive

b) Whenever any word from the lexicon is within the scope of a negation (e.g. "never loved"), swap the values of the positive and negative weights and recompute the sentiment of the text. Show the details of the computation. [10 points]

Solution:

Positive
